

# Guidance for Non-Clinical Worksites and Employees During COVID-19

Revised July 23, 2020

This guidance document is intended for businesses and their employees, including permanent, temporary, contract, and volunteer staff. This guidance is <u>not</u> intended for <u>critical infrastructure</u><sup>3</sup> worksites and employees. For detailed information on regulations and requirements for each business type, please reference the <u>Phase 4 Restore Illinois Guidelines</u>.

### What can I do to prevent COVID-19 from spreading at my worksite?

- All workers should wear a mask at all times in congregate settings, when working with others, or when social distancing is not feasible.
  - If disposable masks are unavailable, cloth face coverings may be used. See <u>these CDC</u> <u>guidelines</u> on how to create a cloth face covering.
- Screen all staff entering the premises daily for temperature and symptoms of COVID-19. These symptoms include:
  - Fever or chills
  - Cough
  - Shortness of breath or difficulty breathing
  - o Fatigue
  - Muscle or body aches
- Send home anyone with symptoms listed above.
- All staff should **stay home** if sick.
- Send employees home if they have a family/household member who is a confirmed or presumed positive case (exhibiting COVID-19 symptoms).
  - If the employee has been diagnosed with symptomatic COVID-19 within the last 3
    months and remains asymptomatic after recovery, they are not recommended to selfquarantine due to close contact.
- Staff should sanitize their work area before starting their shift. This includes wiping down surfaces with disinfectant wipes.
- Staff should wash hands often, cover coughs and sneezes, and avoid touching shared surfaces.
- Staff should practice social distancing and remain at least 6 feet apart.
- Do not allow gatherings of more than 50 people. Use virtual meetings whenever possible.

## What should I do if a staff member tests positive for Coronavirus Disease 2019 (COVID-19) or has direct exposure<sup>1</sup> to a positive case?

- You may be informed by the individual themselves or by the Health Department that a worker at your business has tested positive or has been directly exposed to a positive COVID-19 case.
  - When the Health Department is notified of the positive test, they will contact you to help with the case follow-up.
- For a confirmed or presumed positive case (someone who has COVID-19 symptoms<sup>2</sup>), if the individual is still at work, **immediately have them put on a mask (if available) and send them home. Instruct them to isolate for at least 10 days. They must be fever/symptom free without**

- Headache
- New loss of taste or smell
- Sore throat
- Congestion or runny nose
- Nausea or vomiting
- Diarrhea

# Guidance for Non-Clinical Worksites and Employees During COVID-19

Revised July 23, 2020

**medication for at least 24 hours before returning to work.** They should also contact their provider or the Health Department for guidance.

- Family/household members of the case are considered high risk and must selfquarantine to monitor for symptoms.
  - Family/household members with separate living quarters between case and contacts must quarantine for 14 days after last exposure to case.
  - Family/household members that share a room/living quarters (i.e. have ongoing contact with or exposure to the case) must quarantine during contact and for 14 days after case is released from isolation.
  - Family/household members that have been diagnosed with symptomatic COVID-19 within the last 3 months and remain asymptomatic after recovery are not recommended to self-quarantine due to close contact.
- Send home other workers who were **directly exposed**<sup>1</sup> to the case (close contacts).
  - Close contacts should self-quarantine at home for 14 days from the date of last contact with the case to monitor themselves for symptoms.<sup>2</sup>
  - Workers that have been diagnosed with symptomatic COVID-19 within the last 3
    months and remain asymptomatic after recovery are not recommended to selfquarantine due to close contact and do not need to be sent home.
  - Family/household members of close contacts are **not** considered high risk and do not need to self-quarantine unless the close contact develops symptoms.
- If possible, close down areas used by the case and close contacts (including common areas) for thorough disinfection of all surfaces, especially high-touch surfaces.
  - Closing the area is not necessary if little or no common surfaces are used by the case or close contacts.
  - Once the case and close contacts have been sent home and their work areas have been disinfected, the worksite may re-open and other staff may return.

#### <sup>1</sup> What is considered direct exposure to COVID-19? (Who is a close contact?)

- Direct exposure to a COVID-19 case (close contact) means an individual had at least 15 minutes of cumulative contact AND that contact was within 6 feet of the infected person during the period starting 48 hours before symptom onset(or, for asymptomatic persons, 10 days prior to positive specimen collection) until the time the patient is isolated.
- COVID-19 is primarily transmitted through droplets from coughing, sneezing, or talking. These
  droplets do not remain in the air. They fall to the ground or surfaces. This means that being in
  the same room as a case does not necessarily mean the person was directly exposed.
  - Transmission occurs when an uninfected person either inhales droplets or ingests them by touching infected surfaces and then touching their mouth, nose, or eyes.

### Does my business need to close if a worker tests positive for COVID-19?

Only businesses that have areas open to public access in which a worker is a confirmed or
presumed positive COVID-19 case AND the individual worked in the facility within the last 72
hours must temporarily close down the public-accessible areas and all work areas used by the
case and close contacts and:

# Guidance for Non-Clinical Worksites and Employees During COVID-19

Revised July 23, 2020

- Clean and disinfect all public-accessible areas of the facility, especially high-touch surfaces;
- o Clean and disinfect all work areas used by the case and close contacts; and
- Abide by all worker restrictions in this guidance document and any guidance provided by Health Department staff.
- After the case and close contacts have been sent home and the areas described above have been cleaned and disinfected, the worksite may re-open and other staff may return.

### When can a confirmed or presumed positive case of COVID-19 return to work?

- A worker in isolation for 14 days due to close contact should monitor for symptoms and take temperature twice daily. If symptoms appear, they should inform their healthcare provider and employer.
  - If symptoms do not appear after 14 days of isolation, the individual may return to work.
- A worker who is sent home or stays home with COVID or COVID-like symptoms should obtain a medical evaluation and/or be tested for COVID-19 to determine next steps.
- Confirmed/presumed positive cases must isolate for a minimum of 10 days after symptom onset or a positive test (whichever is first) AND must be fever and symptom-free for at least 24 hours.<sup>2</sup> Both criteria must be met in order for the staff member to return to work.
  - Example 1: A staff member tests positive and is fever free and feeling well on day 8.
     They should not return to work until day 10. They must isolate for the minimum 10 days
     AND be fever and symptom-free for 24 hours.
  - Example 2: A staff member tests positive, isolates, but fever and symptoms do not end until day 12 after a positive test. They should not return until day 13. Even though the minimum 10-day isolation requirement was met, the staff member could not return to work until they were fever and symptom-free for 24 hours.
- An employee whose family/household member is a confirmed or presumed positive case must self-quarantine for a minimum of 14 days after the last/most recent contact with the case when the case was infectious.
  - Example 1: A household case is feeling well 3 days after symptom onset (or positive test): Employee must remain quarantined and not return to work until day 24.
  - Example 2: A household case is feeling well 14 days after symptom onset (or positive test): Employee must remain quarantined and not return to work until day 31.
  - Exception: If the employee has been diagnosed with symptomatic COVID-19 within the last 3 months and remains asymptomatic after recovery, they are not recommended to self-quarantine due to close contact.
- If your worksite requires employees have a doctor's note before returning to work, that must be obtained by the employee through their healthcare provider. The Health Department only provides return to work notes for its established Community Health Center patients.
